

Hello Testers

I would like you to test my page and functions to see if there are any problems. This is a Ecommerce Webpage.

The following should be tested:

Nav bar function: if all the button (Home and Cart) are functioning and linking to the page that is linked to the button. If a user presses the Cart icon, they should end up on the Cart page and if they press the Home button they should end up on the Main page again and if they press the Product button it must bring the user to the product page.

On the Index.js page: If Data is showing without problem and buttons are working. If Images are visible. On the main page the Images and card should be showing in a Column. Buttons should link to the Product page.

On the Product.js: If the Image is showing and the drop down and button are working and if prompt message show when adding things to Cart. The drop down should give the user more option to the product like different colour choices. "add to Cart" button should add and show a prompt message showing you have added the Item to the Cart. Prompt message button should bring the user back to the main page.

On the Cart.js: If the table is showing the items the user has added to the Cart with price and Colour choices and the Button function works. Price must show and as a total and the bottom of the page so the user knows the total of their purchases

On the order-confirm.js: If Form has the required field and need filling and if its works and the button give a prompt Messages confirming that the order was confirmed. Form fields must indicant (if left empty) that they need to be filled out before confirming the order and button must give message. Message must show and button must bring user back to the main page.

Responsiveness: to make sure that all page will work on mobile devices.

The page must work on Mobile devices and the navbar should change to a dropdown Nav bar.

With regards

Ben
